1	 Standard speed switch VS  four-proof accelerator with dustproof, waterproof, shockproof, and anti-burn	★Four-Security Patent Accelerator ➡Most off-road on the market the electronic components on the circuit boards inside traditional accelerators are prone to burnout; harsh humid environments can easily cause short circuits; and the operation buttons lack waterproof functionality, thereby increasing the failure rate.	
2	 no cylinder guard VS  with cylinder guard keeps motor, cylinder and wiring harness dustproof, waterproof, long-lasting.  welded cylinder base VS  One-piece thick cylinder mount, strong & stable.  standard screw for oil hole, VS  breather screw on oil hole, protects cylinder from overpressure.	★Heavy-duty hydraulic cylinder with a cylinder rod diameter of 50 mm, featuring built-in anti-jamming design. ➡Most off-road on the market hydraulic cylinders typically feature cylinder rod diameters below 50 mm, resulting in limited service life under prolonged heavy-load conditions. The lifting height of the hydraulic cylinder is controlled by limit switches; however, if these switches suddenly fail, the cylinder lever may lift excessively, dislodging the cylinder body and increasing the failure rate.	
3	 standard motor VS  permanent magnet brushless maintenance-free motor, dustproof & waterproof faster heat dissipation	★TianyuLux equipped with 1kW motor, ensuring stable performance and low failure rates. ➡Most off-road on the market have partially inflated motor power ratings, resulting in average performance.	
4	 300×100 mm small rubber tire. VS  350×100 heavy-duty solid rubber tire: off-road durable & high-grip.	★TianyuLux with high-quality rubber drive wheels with a large diameter of 350×100 mm, offering exceptional off-road performance and wear resistance, with a normal service life of approximately two years. ➡Most off-road on the market ranges from 250 to 300mm, with a relatively short service life.

5	 cast iron gearbox VS sealed aluminum gearbox, high ratio/large module, low noise, long gear/bearing life.	★A fully sealed, highly silent large-modulus gearbox assembly featuring premium synthetic grease, heavy-duty large-modulus gears, and high-lubricity bearings ensures low noise levels, extended service life, and dust and water resistance. ➡Most off-road on the market feature compact dimensions, low gear modulus, and employ standard lubricants along with conventional bearings. These designs often exhibit issues such as excessive noise, susceptibility to bearing failure, rapid gear wear, and shortened gearbox service life.
6	 增加防尘套 dust cover added	★A dust-proof protective cover is added to the steering bearing below the hydraulic cylinder. ➡Effective dustproof, waterproof, and mudproof protection extends bearing service life while enabling smoother and more effortless handle steering. ➡Most off-road on the market lacks an additional dust-proof cover, allowing water, sand, dust, and debris to easily enter the bearings and cause damage. This also makes steering operation more strenuous.
7	 No backup emergency lift button. VS backup emergency lift button added for safety.	★Standard emergency lifting button ➡Most off-road on the market lack an emergency lifting button. In the event of accelerator or relay failures, the machine becomes completely immobilized and cannot be lifted properly, compromising its usability and delaying project schedules.
8	 Dual-mode Function Switch Button	★Standard dual-mode function ➡Most off-road on the market lack dual-mode functionality, resulting in generally poor operational experience when used in confined indoor spaces or for transporting liquids and large-volume goods.
9	 普通拉杆。 VS solid square steel pull rod, high strength, durable.	★The 30×30 solid pull rod offers higher strength, resistance to deformation and bending, and is made of genuine material for longer and more stable service life. ★The inner side of the fork reinforcement rib is welded with 8mm thick solid-core steel plate, offering higher load-bearing strength and a greater safety factor, thereby extending the frame's service life. ➡Most off-road on the market use hollow control rods, which offer low safety ratings, are easy to deformation, and increase the failure rate.

10	 standard load wheel. full-bearing nylon load wheels, long-lasting.	★ four bearings load wheel ➡Most off-road on the market only with two bearings. Under harsh operating conditions, the bearing lifespan is short; failure of just one bearing broken the machine immediately unusable, disrupting project schedules.
11	 through-connected low fork plate, high strength, anti-deformation.	★ Standard low-fork function ➡Most off-road on the market typically lack a low-fork function, making them ill-suited for handling deformed or low-pallet loads.
12	 no tool kit standard tool kit included	★ Standard toolkit for easy maintenance ➡Most off-road on the market do not come with a standard toolkit, making maintenance inconvenient.
13		★ The load-bearing frame, rocker arm, and other key components ➡Add wear-resistant copper sleeves and grease holes to extend the service life of components and facilitate maintenance. ➡Most off-road on the market lack wear-resistant copper sleeves and lubrication holes in key components, making these parts prone to damage and difficult to maintain.
14	 handle wire motor wire controller wire	★ Standard configuration: 4mm² thicker, high-quality silicone wire ➡Soft and resistant to bending, extending service life. With low-temperature resistance up to -40°C and high-temperature resistance up to 100°C. ➡Most off-road on the market with standard wiring harnesses, which exhibit limited flexibility, resulting in a higher failure rate and shorter service life.
